Introducing Today's Project!

Project overview

In this project, I will demonstrate setting up an S3 bucket to host a website.

Tools and concepts

In this project I learned about Amazon S3 and how to use it to host a static website. Key concepts included creating an S3 bucket, making files publicly accessible using ACLs, enabling static website hosting, and controlling access with bucket policies.

Time, challenges, and wins

This project took me approximately. 40 minutes. The hardest part was making it public using ACL but it was quite fun and exploring how to make both files public with ACL

How I Set Up an S3 Bucket

What I did in this step

In this step, I will open the Amazon S3 to create a storage website for the files.

How long it took to create the bucket

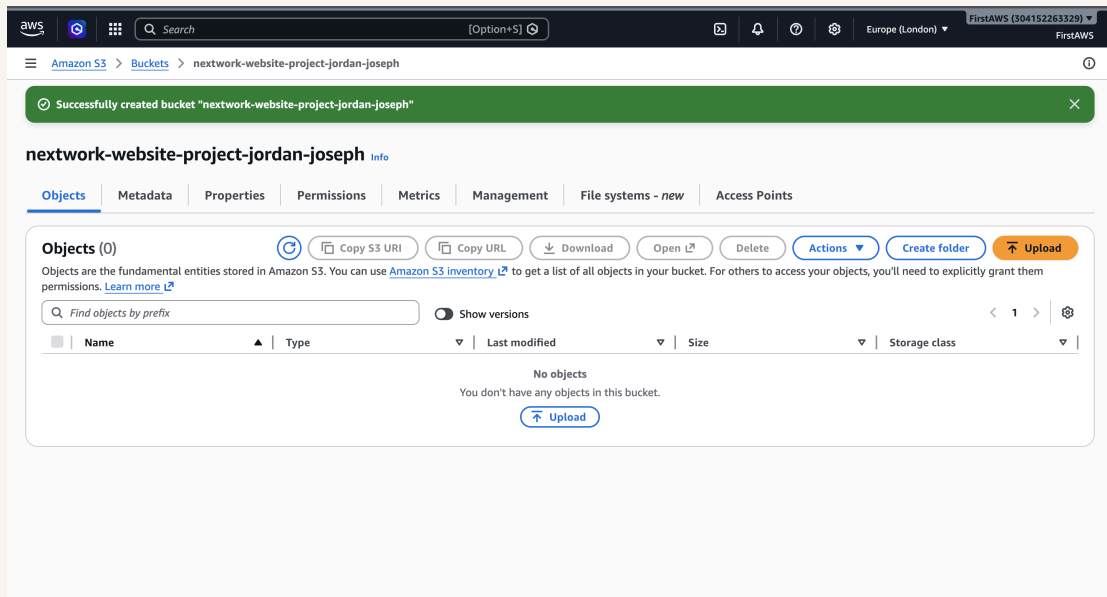

Creating an S3 bucket took me a few minutes to complete.

Region selection

The Region I picked for my S3 bucket was Europe (London) eu-west-2 as it was the closest to my location

Understanding bucket name uniqueness

S3 bucket names must be globally unique because each bucket gets its own URL

Upload Website Files to S3

What I did in this step

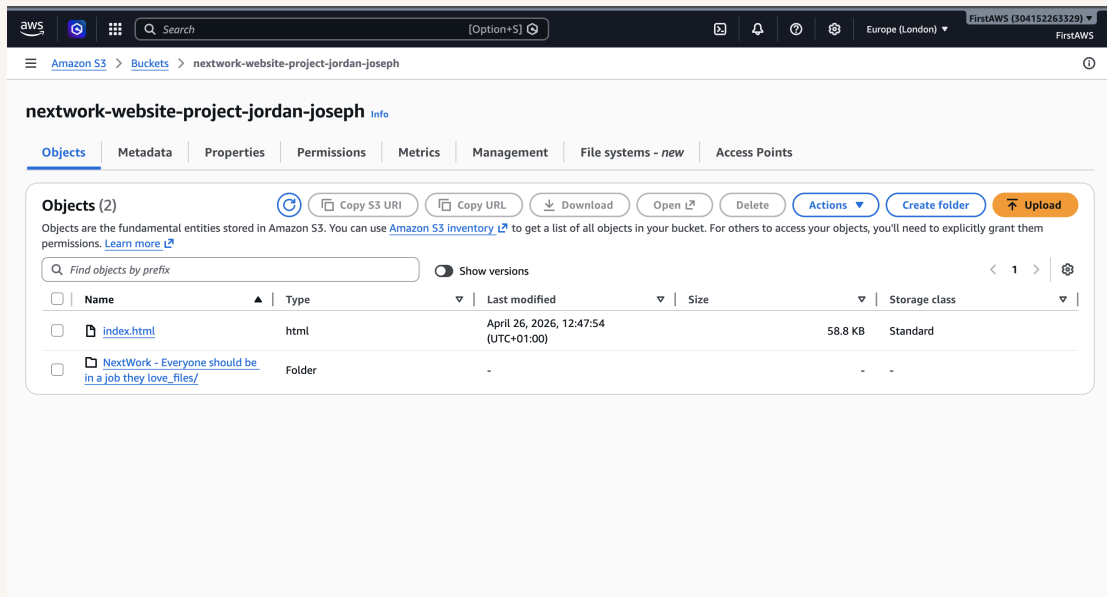

In this step, I will be downloading an HTML file that sets up your website, download a zip file of images for your webssite and uploading both files into the S3 bucket.

Files I uploaded

I uploaded two files to my S3 bucket - they were the index.html and the NextWork folder

How the files work together

Both files are necessary for this project as the index.html sets up the website and the folder holds images for the website

Static Website Hosting on S3

What I did in this step

In this step, I will be configuring my S3 bucket for static website hosting.

Understanding website hosting

Website hosting simply means storing your website's files somewhere so that other people can access them over the internet

How I enabled website hosting

To enable website hosting with my S3 bucket, I navigated to the bucket's Properties tab, scrolled down to Static Website Hosting, clicked Edit, enabled it, and set the index document to index.html

Access Control Lists (ACLs)

An Access Control List (ACL) is a set of rules that controls who can access a resource and what they can do with it. In the context of S3, ACLs define which AWS accounts or groups are allowed to read or write to a bucket or its objects. I enabled mine

Info

Static website hosting

Use this bucket to host a website or redirect requests. [Learn more](#)

Static website hosting

☐ Disable

☒ Enable

Hosting type

☒ Host a static website

Use the bucket endpoint as the web address. [Learn more](#)

☐ Redirect requests for an object

Redirect requests to another bucket or domain. [Learn more](#)

For your customers to access content at the website endpoint, you must make all your content publicly readable. To do so, you can edit the S3 Block Public Access settings for the bucket. For more information, see [Using Amazon S3 Block Public Access](#)

Index document

Specify the home or default page of the website.

index.html

Error document - optional

This is returned when an error occurs.

error.html

Redirection rules - optional

Redirection rules, written in JSON, automatically redirect webpage requests for specific content. [Learn more](#)

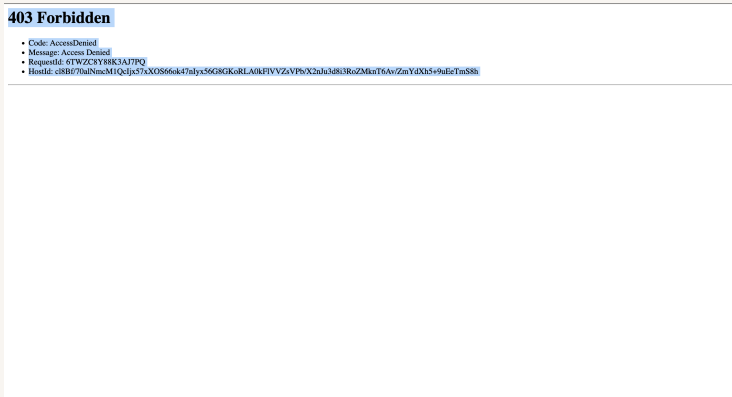

Bucket Endpoints

Understanding bucket endpoint URLs

A bucket website endpoint URL is the web address that AWS generates for your S3 bucket when you enable static website hosting. It's the link people use to visit your website in a browser.

What I saw when I tested the endpoint

When I first visited the bucket endpoint URL, I saw a 403 error. The reason for this error was because my files were not set as public

403 Forbidden

- Code: AccessDenied
- Message: Access Denied
- RequestId: 6792Z3Y8K3AJ7PQ
- HostId: c8B670a1NmcM1QcJy37X0S66k47aly39G8GK6RLA0kFTVVZaVPS/X2ah348336zMKr16AvZnYdXh59uEeTas88

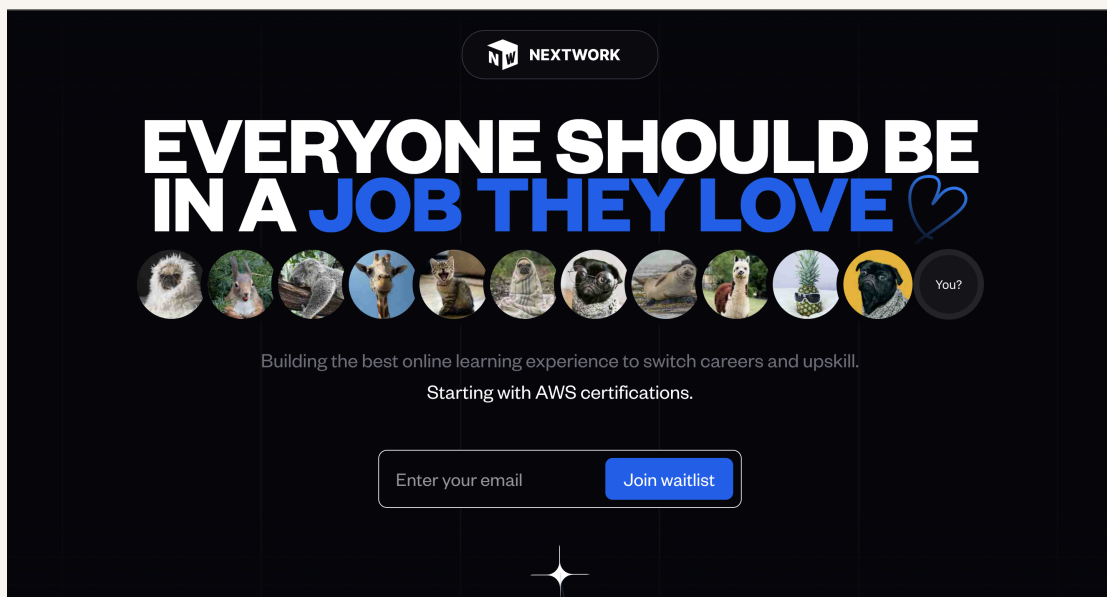

Success!

What I did in this step

In this step, I will be making my website files in S3 publicly accessible so that I can see my website live on the internet

How I resolved the 403 error

To resolve this 403 Forbidden error, I had to make objects in my S3 bucket public

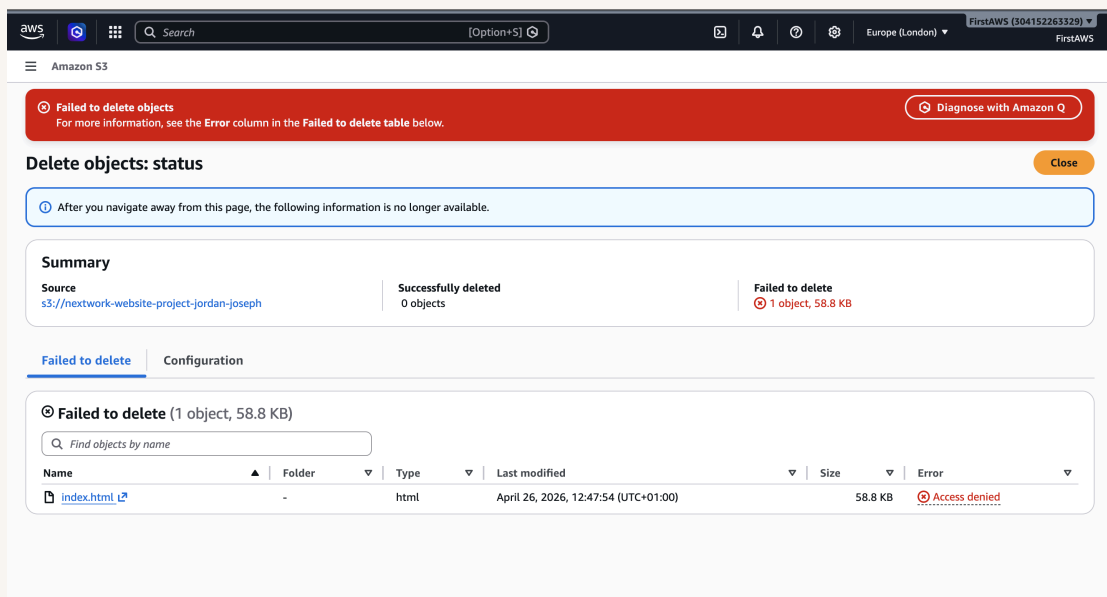

Bucket Policies

What I did in this extension

In this project extension I'm about to edit my bucket policies so that my index.html cannot be deleted by others

Understanding bucket policies

An alternative to ACLs are bucket policies, which are a set of rules

What my bucket policy does

My bucket policy stops any user from deleting my index.html. I tested this by attempting to delete my own file and I was denied
