

Creating a Private Subnet

JJ

joseph1608@outlook.com

The screenshot shows the 'Create subnet' page in the AWS Management Console. The page is titled 'Create subnet' and includes a breadcrumb trail: 'VPC > Subnets > Create subnet'. The main form is divided into several sections:

- VPC:** A dropdown menu for 'VPC ID' is set to 'vpc-05a779f5 (Subnet 1 on 14 Amazon VPCs)'.
- Associated VPC CIDRs:** A list showing 'IPv4 CIDRs' with the value '10.0.0.0/16'.
- Subnet settings:** A section titled 'Specify the CIDR blocks and availability zone for the subnet.' containing:
 - Subnet 1 of 1:**
 - Subnet name:** A text input field containing 'Nextwork Private Subnet'.
 - Availability zone:** A dropdown menu set to 'Europe (London) / euw-2-acc5 (eu-west-2)'.
 - IPv4 VPC CIDR block:** A dropdown menu set to '10.0.0.0/16'.
 - IPv4 subnet CIDR block:** A text input field containing '10.0.1.0/24'.
- Tags - optional:** A section for adding tags, with one tag already added: 'Name' with the value 'Nextwork Private Subnet'.

At the bottom right of the form, there are 'Cancel' and 'Create subnet' buttons.

Introducing Today's Project!

What is Amazon VPC?

Amazon Virtual Private Cloud (VPC) is a virtual network that allows users to launch AWS resources in a logically isolated section of the Amazon Web Services (AWS) cloud

How I used Amazon VPC in this project

Within the Amazon VPC, I incorporated NACLs to make my subnets more secure

One thing I didn't expect in this project was...

How smooth the process is for creating the necessary resources

This project took me...

20 minutes

Private vs Public Subnets

The difference between public and private subnets is that a public subnet can be accessed from the internet, while a private subnet cannot

Having private subnets are useful because they allow organizations to separate resources for different departments, projects, or environments, while still allowing for efficient network management

My private and public subnets cannot have the same CIDR block

The screenshot shows the 'Create subnet' page in the AWS Management Console. The page is titled 'Create subnet' and has a breadcrumb trail: 'VPC > Subnets > Create subnet'. The 'VPC' section shows the 'VPC ID' as 'vpc-00478616de146114' (NextWork VPC). The 'Subnet settings' section is active, showing 'Subnet 1 of 1'. The 'Subnet name' is 'NextWork Private Subnet'. The 'Availability Zone' is 'Europe (London) / euw2-as1 (eu-west-2b)'. The 'IPv4 VPC CIDR block' is '10.0.0.0/16'. The 'IPv4 subnet CIDR block' is '10.0.1.0/24'. There is a 'Tags' section with one tag: 'Name' with value 'NextWork Private Subnet'. At the bottom right, there are 'Cancel' and 'Create subnet' buttons.

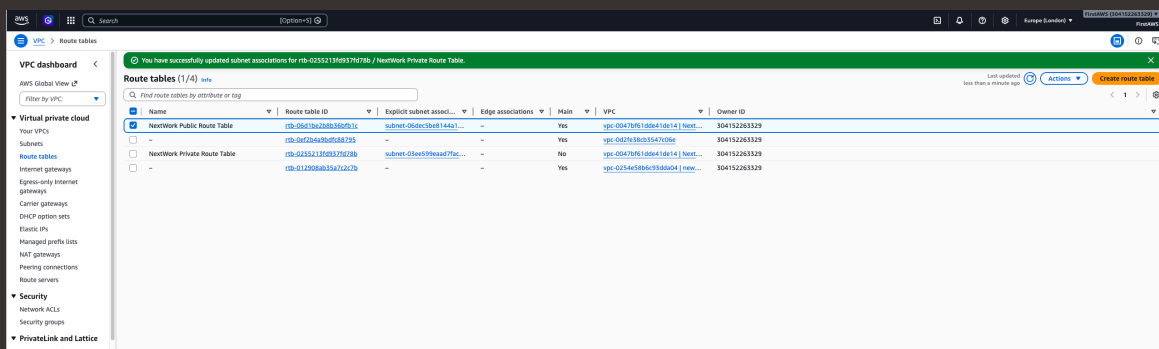

A dedicated route table

By default, my private subnet is associated with a public route table.

I had to set up a new route table because the default route table had public access and we want this new one to be private

My private subnet's dedicated route table only has one inbound and one outbound rule that allows traffic between resources within the VPC

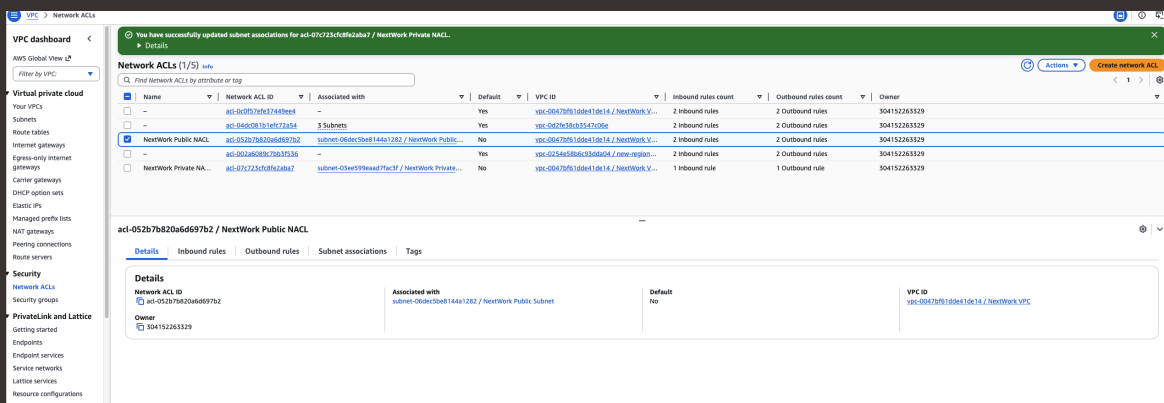

A new network ACL

By default, my private subnet is associated with the public NACL which has to be changed to the private NACL

I set up a dedicated network ACL for my private subnet because there is still a security risk of my private subnet being accessed

My new network ACL has two simple rules - no inbound or outbound traffic
